

LZT Launches Instant Messaging Server®

News Release

Enterprise 2.0 Instant Messaging Server®

8th of May 2008- Perth, Australia

Level Zero Technologies is pleased to announce the general release of its Enterprise 2.0 - **Instant Messaging Server®**. The Instant Messaging Server® is part of a family of real time collaboration and communications (RTCC) solutions offering an advanced productivity environment for innovative organizations.

Instant Messaging Server® can deliver major productivity improvements with its Enterprise 2.0 architecture. Features include a robust hardware platform with industry leading open and commercial software components. The LZT **Instant Messaging Server®** delivers an unprecedented level of functionality and performance for enterprise wide communications by delivering secure, federated, instant messaging (IM) services.

The Instant Messaging Server® uses the **XMPP** protocol (also known as Jabber) the leading open standard for presence and real-time messaging. Since 2004, it's been an approved standard of the IETF (the same organization that standardized email and World Wide Web protocols). Today, XMPP is used by leading companies, millions of users worldwide and has proven to be the best choice for open real-time collaboration and communications.

IDC estimates that enterprise IM will grow from 40 million users today to more than 140 million by 2009, making it the fastest growing communications medium of all time while an INT Media Research report found that 81% of companies that are using IM say their

employees are more productive. The study also found that email traffic was reduced by up to 40% and overall voice mail was down 10%.

Facilities include: archiving (full compliance for regulatory authorities), public gateway access (Google Talk, Yahoo, AIM, ICQ, and MSN etc), VOIP integration (IAX and SIP support), presence (across all the LZT RTCC components), security and federation (SSL encryption and authentication against Active Directory or an LDAP server), scalability (ten of thousands of concurrent users), client software (PC, Mac and Linux versions), web chat (online chat support facilities) and full online administrator management.

About Level Zero Technologies:

Level Zero Technologies has taken the concept of **Enterprise 2.0** and developed a range of complimentary solutions that fulfill the need for unified real time collaboration and communications within enterprises. We have brought together technologies that address collaboration, instant messaging and voice services to enable organizations of any size to share the benefits of a social productivity environment. These solutions are highly scaleable and can operate standalone or be seamlessly integrated as an organisation grows its understanding and use of Enterprise 2.0. technologies.
